## **For Immediate Release**

### **Gen II Extra Capacity FluidForming Machine Takes on the Big Jobs**

**Hartsville TN, USA:** FluidForming Americas introduces one of the industry's largest and most capable bladderless fluid forming machines available on the market, the FormBalancer FB42. Now available for the first time in the US, the FormBalancer FB42, rounds out a highly capable hydroforming product line that allows unparalleled precision metalwork for almost any application and in a wide array of materials. The FB42 offers the ability to create larger single prototypes or oversized high run parts that require the extra-large 47 inch square forming table capacity. FluidForming Americas also offers the FormBalancer FB35 and FormBalancer FB25, for smaller applications.

FormBalancers utilize a forming pressure of up to 60,000 psi that allow complex parts creation, at lower costs, in a wide variety of metals such as titanium, aluminum, stainless steel, and copper without the use of trouble-prone bladders.

"The expansion of the FormBalancer product line speaks to the accuracy, repeatability, and cost effectiveness of parts that can be produced with this platform", said Paul Benny, President of FluidForming Americas.

During the last decade, the FormBalancer line of products has seen widespread utilization in the automobile, aerospace, and medical industries to minimize operating costs and maximize production versatility. This allows companies to reduce cycle times, explore previously untapped product opportunities at lower costs and increase their overall profitability.
